

Ideation Phase

Brainstorm & Idea Prioritization Template

Date	29 September 2026
Project Name	Metro Ticket Generating System in ServiceNow
Maximum Marks	4 Marks

Brainstorm & Idea Prioritization Template:

Brainstorming provides a free and open environment for generating multiple possible solutions before selecting one. In this project, the team explored different ways to reduce metro ticketing delays, automate fare handling, improve ticket validation, and centralize booking information.

The shortlisted ideas were then grouped and prioritized using two major criteria: importance to the customer and feasibility of implementation within ServiceNow.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Selected Problem Statement

Metro passengers need a faster and more reliable way to book tickets, know the correct fare, and receive verifiable digital tickets without depending entirely on manual counters or paper tickets. At the same time, metro operations teams need a centralized system that reduces manual intervention, avoids fare and data inconsistencies, and supports efficient ticket validation and request tracking.

Key brainstorming rules followed

- Focus first on the customer problem, not on a fixed technical solution.
- Generate several ideas without rejecting them during the initial brainstorming stage.
- Consider both passenger experience and metro operations requirements.
- Prefer solutions that can be built and maintained using ServiceNow low-code capabilities.
- Keep future scalability in mind, including payments, notifications, and analytics.

Step-2: Brainstorm, Idea Listing and Grouping

The team generated multiple ideas around the selected metro ticketing problem and grouped them by functional area so that overlapping ideas could be combined into stronger solution concepts.

Passenger Experience

Self-service metro ticket booking through ServiceNow Service Portal	Simple Source and Destination selection	Passenger Type and Number of Tickets as guided form inputs	Request status tracking after ticket submission	Digital ticket instead of paper-based confirmation
---	---	--	---	--

Fare & Journey Logic

Automatic fare calculation based on Source and Destination	Station-to-station fare mapping / fare bands	Automatic total based on number of tickets	Validation to prevent incorrect or incomplete route selections	Future support for dynamic fare rules
--	--	--	--	---------------------------------------

Ticket Generation & Validation

Generate a QR-based digital ticket	Show ticket details in a Service Portal-compatible modal	Use a widget-based approach for QR rendering	Allow station staff to verify ticket information quickly	Keep ticket data linked with the original booking request
------------------------------------	--	--	--	---

Workflow Automation

Use Flow Designer as the main automation engine	Create and populate metro ticket records automatically	Map catalog variables to the custom Metro Database table	Create tasks dynamically only when required	Use Flow Execution Details for troubleshooting
---	--	--	---	--

Security & Administration

Role-based access for passengers, station staff, operations users, and admins	ACL configuration for ticket data protection	Keep custom scripting minimal for easier maintenance	Provide step-by-step setup documentation for another PDI	Maintain clear separation between requester and fulfiller activities
---	--	--	--	--

Future Enhancements

UPI / payment gateway integration	Email-based digital ticket delivery	SMS / WhatsApp ticketing	Travel analytics dashboard	Passenger behavior and peak-time analysis
-----------------------------------	-------------------------------------	--------------------------	----------------------------	---

Grouped Solution Concept

The strongest combined concept was a ServiceNow-based digital metro ticketing system where a passenger books through a Service Catalog item, the system calculates the fare automatically, Flow Designer processes and stores the booking, and a QR-based digital ticket is generated for validation. The design also supports role-based access, request tracking, maintainable low-code automation, and future integration with payment and communication channels.

Step-3: Idea Prioritization

Ideas were prioritized using two criteria from the template: how important the idea is to solving the customer problem and how feasible it is to implement within the available ServiceNow environment.

Idea	Customer Importance	Feasibility	Priority	Decision
Service Catalog ticket booking form	High	High	1	Implement
Automated fare calculation	High	High	2	Implement
Flow Designer automation	High	High	3	Implement
Custom Metro Database table	High	High	4	Implement
QR-based digital ticket	High	Medium-High	5	Implement
Request status tracking	High	High	6	Implement
ACL and role-based access	High	High	7	Implement
Email / SMS ticket delivery	Medium-High	Medium	8	Future Enhancement
Payment gateway / UPI	High	Medium-Low	9	Future Enhancement
Travel analytics dashboard	Medium	Medium	10	Future Enhancement
WhatsApp-based booking	Medium	Low-Medium	11	Future Enhancement

Prioritization Matrix Interpretation

	Lower Feasibility	Higher Feasibility
Higher Importance	Payment gateway / UPI Email / SMS delivery	Catalog booking Fare calculation Flow Designer QR ticket Custom table ACLs
Lower Importance	WhatsApp booking	Travel analytics dashboard

Final Prioritized Idea

Develop a ServiceNow-based Metro Ticket Generating System that provides a Service Catalog booking experience, automatic fare calculation, Flow Designer-based automation, centralized ticket data storage in a custom table, QR-based digital ticket generation, request tracking, and role-based access control. Payment gateways, SMS/email/WhatsApp ticket delivery, and travel analytics are retained as future enhancements because they add value but are not essential to the first working version.
