

Project Development Phase

Functional & Performance Testing

Date	29 September 2026
Project Name	Metro Ticket Generating System in ServiceNow
Maximum Marks	

Test Scenarios & Results

The template has been adapted to the actual ServiceNow metro-ticketing workflow. Test cases cover form validation, fare calculation, workflow execution, data mapping, QR rendering, security, and response behaviour. Actual results are recorded from the implemented project description; where an exact measured timing value was not supplied, the result is stated qualitatively rather than fabricated.

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
FT-01	Source & Destination validation	Open catalog item; select valid source/destination; test same or missing station combinations.	Valid route accepted; invalid/incomplete combination blocked or clearly handled.	Form and route selection validated through portal testing.	Pass
FT-02	Passenger Type & Ticket Count validation	Select passenger type; enter valid and invalid ticket counts.	Valid values accepted; invalid values rejected or constrained.	Catalog variables and client-side validation behaved as configured.	Pass
FT-03	Fare calculation	Choose representative station pairs and ticket quantities; compare calculated fare with configured fare logic.	Fare matches configured route/fare-band logic.	Fare mismatches were found during development, debugged, and corrected using logs/tests.	Pass
FT-04	Request submission & Flow Designer	Submit a complete metro ticket request; inspect Flow Designer Execution Details.	Request/RITM created and flow completes through intended condition path.	Execution Details used to verify steps and troubleshoot failures.	Pass
FT-05	Variable-to-field mapping	Submit booking; compare catalog variables with Metro Database fields.	All mapped values stored correctly in the custom table.	Initial misalignment/missing bindings were corrected and retested.	Pass
FT-06	QR ticket rendering	Complete a booking and open ticket in Service Portal.	QR/ticket view renders reliably in portal.	Portal sandbox issue resolved through widget + spModal architecture.	Pass
FT-07	Request status tracking	Submit request and review status from portal.	Passenger can view current request status.	Request tracking available in the implemented workflow.	Pass
FT-08	Role / ACL access	Attempt record access with requester and operational/admin roles.	Users only see actions/data allowed by configured roles and ACLs.	Role/ACL configuration included in the solution and tested during security/UAT.	Pass
PT-01	Portal response behaviour	Open catalog, change variables, calculate fare, submit request, open QR ticket.	User-visible actions should complete without abnormal delay or interface freezing.	No measured millisecond/second benchmark was supplied; functional response was acceptable during testing.	Pass
PT-02	Repeated request execution	Submit multiple representative bookings sequentially and inspect executions.	Each request should create independent records and execute without cross-request data corruption.	Workflow and data storage were validated with sample requests.	Pass
PT-03	Portal compatibility / load	Use form preview and Service Portal; exercise UI policies, field population and QR view.	Portal remains stable and components render consistently.	QR compatibility issue was fixed; form behaviour confirmed in Service Portal testing.	Pass
