

User Acceptance Testing (UAT) Template

Metro Ticket Generating System in ServiceNow

Date	29 September 2026
Team ID	
Project Name	Metro Ticket Generating System in ServiceNow
Maximum Marks	

Project Overview:

Project Name	Metro Ticket Generating System in ServiceNow
Project Description	A ServiceNow-based digital metro ticketing workflow that captures journey details through Service Catalog, calculates fares, processes requests through Flow Designer, stores booking data in a custom Metro Database table, and presents a QR-based digital ticket for validation.
Project Version	Academic / Project Prototype
Testing Period	Project UAT cycle - final development/testing phase

Testing Scope:

- Service Catalog booking form and journey variables
- Fare and station mapping logic
- Request/RITM creation and Flow Designer execution
- Variable-to-field mapping into the custom Metro Database table
- QR ticket generation and Service Portal rendering
- Request status tracking
- Roles and ACL-based access
- Portal compatibility, UI policies and minimal Catalog Client Script behaviour
- End-to-end passenger-to-station-authority workflow

Testing Environment:

URL/Location: ServiceNow Personal Developer Instance / Service Portal used for the project.

Credentials: Role-specific test accounts or authorized users as configured in the instance. Passwords are intentionally not included in documentation.

Test Cases:

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-001	Open metro booking catalog	Open Service Portal -> select metro service catalog item.	Booking form opens with required variables.	Booking form opened successfully.	Pass
TC-002	Valid journey booking	Select valid source/destination, passenger type, ticket count; submit.	Fare is calculated and request is created.	Request created and workflow started.	Pass
TC-003	Invalid/incomplete inputs	Leave required values blank or use invalid combination.	System prevents invalid submission or clearly handles it.	Form validation/UI behaviour worked as configured.	Pass
TC-004	Fare validation	Test representative source/destination and ticket quantities.	Displayed/stored fare matches configured fare logic.	Earlier fare mismatches were corrected; retest matched expected logic.	Pass
TC-005	Flow Designer execution	Submit booking; inspect execution details.	Flow completes intended actions without unhandled failure.	Execution Details confirmed path after fixes.	Pass
TC-006	Metro Database mapping	Compare request variables against custom table record.	All required values map to correct fields.	Misaligned/missing mappings were corrected and verified.	Pass
TC-007	QR ticket display	Open generated ticket in Service Portal.	QR/ticket renders consistently in portal.	Widget + spModal solution rendered correctly after portal fix.	Pass
TC-008	Request status tracking	Check submitted request from requester view.	Passenger can see request status.	Status tracking available.	Pass
TC-009	Role-based access	Test requester vs operational/admin access.	Data/actions restricted by role and ACL.	Access configuration tested in project workflow.	Pass
TC-010	End-to-end walkthrough	Book ticket -> process -> store data -> open QR -> verify as station authority.	Entire user journey works in correct sequence.	End-to-end demo completed as documented.	Pass

Bug Tracking:

Bug ID	Bug Description	Steps to Reproduce	Severity	Status	Additional Feedback / Resolution
BG-001	QR ticket did not render reliably in Service Portal due to portal sandbox/context limitations.	Complete booking -> attempt portal QR display -> observe inconsistent rendering.	High	Closed	Resolved using Service Portal-compatible widget and spModal architecture.
BG-002	Fare mismatches occurred for some route selections.	Select affected source/destination -> calculate fare -> compare expected value.	High	Closed	Fare logic/mapping debugged using logs and retested.
BG-003	Catalog variables were misaligned or missing in custom-table fields.	Submit request -> inspect target Metro Database record -> compare values.	Medium	Closed	Variable-to-field bindings and dynamic population corrected.
BG-004	Flow execution failures / incorrect paths during configuration.	Submit test request -> inspect Flow Designer Execution Details.	Medium	Closed	Execution logs used to locate failed steps/conditions and verify corrected path.
BG-005	UI visibility/population behaviour needed portal-specific testing.	Change relevant form selections in Service Portal preview.	Low	Closed	UI Policies and essential Catalog Client Scripts tested and adjusted.

Sign-off:

Tester Name	_____
Date	_____
Signature	_____
Overall UAT Result	PASS - based on the documented final working workflow and resolved issues.

Notes:

- All test cases should include representative positive and negative inputs.
- Any new issue found after deployment should be added to bug tracking with reproducible steps.
- Payment gateway, SMS/email delivery, WhatsApp booking and analytics are future scope and are not included in current UAT pass criteria.
- Final deployment should proceed only after project owner / evaluator sign-off.
